

Coding Style Plan

1. All brackets will be lined up below the function declaration. e.g.

```
function()  
{  
    Code;  
}
```
2. Naming conventions:
 - a. Use descriptive names over abbreviated names.
 - b. Use camelCase:
 - i. Always start a variable name with a lowercase number.
 - ii. Subsequent words in the name are capitalized.
 - iii. e.g. `userInformation` over `user_info`.
3. Use tabs instead of spaces.
4. Use a blank line of space between chunks of code that are not strongly correlated to increase readability and separate by relevance.
5. Provide comments above any function that say what is it and what it's supposed to do. Comment any code that is relatively elaborate so it is easier for other group members to read and interpret it.
6. No Magic numbers - use constant fields.
7. Include TODO comments for tasks that are left unfinished or if a specific functionality needs to be added or fixed. Gives necessary details for another group member to pick it up from there.
