

Currently Known Bugs in the E-tendance Android Application

- If a day of attendance has been created, then a student adds that class after the attendance day has been set, they cannot be marked for attendance on that day.
- Announcements may have difficulty populating depending on the network connection.
- If you click a button multiple times in quick succession on the emulator, it will create more than one item in the screen stack but appears to have no effect on app functionality.
- After adding an announcement on the professor side, the user is required to hit back and re-enter the Announcements page to view the updated list of announcements. It does not automatically update the listview.
- The UI is not optimized for devices with older operating systems or lower screen resolutions.
